66. The influence of the materials used for electrodes on the breakdown voltage. G.V. Vajda, Thesis for the degree of candidate of science, 1956, 193 p. 94 figs., 34 tabs.

The part played by the physical properties of electrodes in breakdown is dealt with on the basis of the breakdown theories of insulating materials of various states of aggregation. Elementary processes occurring on surfaces and phenomena of emission are analysed. The approximation of the real electrode surface of complicated structure changing in the course of time is theoretically discussed. New conceptions are propounded on the criterion of breakdowns and on the phenomena of emission. Tests were conducted on insulating materials located in negative pressure, atmospheric pressure and positive-pressure gases with a.c. and surge voltages. Great stress was laid on the adequate choice of test conditions, the effect of surface finish was separately analysed. The material of the electrode was found to be of considerable influence in gases with negative pressure and with pressures exceeding 6-8 atm abs. The effect of surface roughness was insignificant below an 8/1 rms average. Therefore it is expedient to take into account the materials used for electrodes in high-voltage equipments where high-pressure gases or vacuum are employed as insulators. The use of stainless steel is the most advantageous. If impracticable, copper offers a greater margin of safety than aluminium.

treatment, facilitating a uniform treatment of the breakdown phenomena. Much of it is the subject of thorough criticism. The latter files with experimental determination of dielectric strength are discussed. It would be necessary to deal with the theory of the breakdown of solid insulating materials and the advancement of experimental technique in wider circles than hitherto perhaps on an international scale. Finally the appendix includes the calculation method of energy bands by the Lagrange operator and formulae for the calculation of the energy bands.

80. Influence of the material properties of electrodes upon the breakdown potential. (In English) (Gy. Vajda. *Acta Technica Academiae Scientiarum Hungaricae*, Vol. 31, 1958, No. 1-2, pp. 141-171, 13 figs.

The electric breakdown potential depends on a number of factors. Investigations were conducted to determine to what extent the material of the electrode exercises an influence. The conditions for the breakdown of insulators in various states of matter are deduced from an equation expressing the instability of the elementary processes taking place in the insulator and the extent to which the elementary processes taking place on the electrodes influence the breakdown is examined. According to these investigations electrostatic emission is the most effective, but in gases photoelectric emission and secondary emission due to positive ions can also play their part. According to the results of the experiments and in agreement with the theoretical assumptions it was found that the material of the electrode had no influence in solid insulators or in gases under atmospheric conditions. In the latter case the quality of the surface has a slight effect therefore it is best to use a surface smoothness of $\phi_s = 1.6-0.8 \mu$. In liquids the influence of the material is obscured by other effects. The effect of the material of the electrodes is considerable in gases at low and high pressures when the breakdown potential increases in the sequence aluminium, copper, stainless steel.

The subject of antibodies in response to tumour cells was studied in a cytotropic system. Tumour cell suspensions gained from operative specimens were treated with the patient's serum and then injected intraperitoneally into mice and the index of phagocytosis of tumour cells by the leucocytes was estimated. The examinations were carried out in different combinations, i.e. the tumour cells were also treated with the sera of other cancer patients and with sera of healthy persons. The sera of cancer patients had no cytotropic effect on their tumour cells or on tumour cells of other patients. Sera of rabbits immunized with cell suspensions of liver tumour showed a slight cytotropic action, whereas serum of rabbits immunized with normal hepatic tissue exhibited no such effect. It is concluded that there is a difference between the antigenic structure of normal and tumour cells.

(349-358) Graphs 2 Tables 4 Illus. 1

Comparative investigations in the determination of the value of agglutinating im-
mune sera were made with Vajda's method (1943) and the filter paper method. The
capillary increase of strains of escherichiae, salmonellae and shigellae suspend-
ed in normal saline was 10-12 cm. in 20-30 min. under identical conditions. The
capillary increase of the bacteria can be inhibited specifically by agglutinating im-
mune sera; the degree of inhibition can be expressed in figures. The specific in-
hibition of the capillary increase of Gram-negative intestinal bacteria is 2-10
times as sensitive as the agglutination method. The increase of Gram-positive
cocci on filter paper is 1-2 cm. in 30 min. After addition of a dilution of 1:100
normal rabbit serum to the coccal suspension, the increase becomes 8-9 cm.
This specific increase can be reduced by about 50% by addition of homologous im-
mune serum in a dilution of 1:100. The method is suitable both for the separation
of Gram-positive cocci and for the demonstration of homologous defence sub-
stances.

2488. LUDÁNY G., VAJDA G. and HITNER I. Orvostud. Egyetem Körélettani Int., Budapest. Szimpatikus izgalom hatása a vérsavó komplement tartalmára. Effect of sympathetic stimulation on the serum complement KISÉRL. ORVOSTUD. 1956, 8/2 (134-140) Tables 8
Adrenaline administered s.c. causes a reversible increase of serum complement by 25% in human subjects. The effect wears off in 2 hr. In dogs under barbiturate or chloralose anaesthesia a similar effect is given by DL-noradrenaline i.v. The carotid sinus pressor reflex and the effects of stimulation of the central sciatic stump after section of the depressor fibres cause an increase of complement in dogs. During splanchnic stimulation the venous blood from the adrenals has a higher complement titre. Electrical stimulation of the splanchnic nerve after ligature of the adrenal veins does not alter the serum complement. Parenterally administered adrenaline still raises the peripheral serum complement level after adrenalectomy. These experiments give further confirmation of the hypothesis that the 'protective substances' of the organism are favoured by the sympathetic system. (II, 4)

Title : The Depressive Effect of Malignant Tumors on the Reticulo-Endothelial System

Orig Pub : Kiserl. orvostud., 1957, 9, No 4, 396-400

Abstract : In rats with a Guerin carcinoma a Cryptococcus neoformans suspension injected intravenously was found to be eliminated from the blood only after 21 minutes (in the control, three to ten minutes). The elimination time of India ink was also delayed in cancerous rats (26 minutes compared with control of 10-15). The injection of defatted carcinoma tissue subcutaneously into rats for five to 10 days delayed the elimination of Congo red from the blood stream. -- A.N. Ivanov

"Coronary Disorders and Cervical Spondylosis."

Budapest, Orvosi Hetilap, Vol 104, No 43, 27 Oct 63, pages 2024-2028.

Abstract: [Authors' Hungarian summary modified] A comparison between patients with angina pectoris and a control group of the same age indicated that changes in the cervical vertebrae were more prevalent among the patients than among the controls. The conclusion was reached that the detailed localization of spondylarthrotic changes and the determination of lesions which may cause irritation in the roots of the cervical nerves of the spine are of utmost importance. In addition to routine X-rays, the performance of X-ray techniques is recommended by which any present limitation to motion as well as the small joints and the foramina are better observed. The technique is routinely used in the Central Institute of Radiology and Ambulant Service of this hospital. It is possible that the simultaneous occurrence of angina pectoris with cervical spondylosis is not a coincidence, but a sign of mutual interaction, somewhat like in omarthritis. 9 Hungarian, 16 Western references.

"Effect of Intravenously Injected Glucocorticoids on the Leukocyte Phagocytosis of Bacteria"

Budapest, Orvosi Hetilap, Vol 107, No 24, 12 Jun 1966, pp 1107-1109.

Abstract: Water-soluble glucocorticoids capable of being administered intravenously (Di-Adreson-F-Aquosum, Urbason, and Oradexon), when given in the generally employed therapeutic range, first decrease and then increase the leukocyte phagocytosis of bacteria. The diphasic effect involves the resistance of the organism against infection also: this fact is of significance to the clinician. The phenomenon is attributable probably to the cell metabolism effect rather than to changes in the segmentation of the granulocytes. 13 references, including 3 Hungarian, 2 German, and 10 Western.

"The Effect of Omentectomy on Erythrophagocytosis."

Budapest, Orvosi Hetilap, Vol 107, No 12, 20 Mar 66, pages 537-538.

Abstract: [Authors' Hungarian summary] Omentectomy performed on rats results in a considerable decrease in the immuno-erythrophagocytosis of leukocytes. According to the findings, the omentum is also connected with the function of the mobile cellular protective installations of the organism. The experimental data are confirmed by statistical calculations. 2 Hungarian, 18 Western references.

"Autospermiumtropin."

Budapest, Orvosi Hetilap, Vol 107, No 31, 31 Jul 66, pages 1459-1460.

Abstract: [Author's Hungarian summary] In vivo cytotropic determinations were carried out with the serum and spermatoplasm of 4 oligospermic and one hypospermic patients. The results indicated autoagglutination in titers between 1:32 - 1:80. The method is more sensitive than autoagglutination and, therefore, the "autospermiumtropin" titer was always higher than the spermagglutination. 5 Eastern European, 5 Western references.

"Simultaneous Determination of Erythro- and Leukocytotropines in Vivo."

Budapest, Acta Microbiologica Academiae Scientiarum Hungaricae, Vol XIII, No 2, 1966, pages 127-132.

Abstract: [English article, authors' English summary modified] A new method has been worked out for the simultaneous determination of erythro- and leukocytotropines in vivo. Mixtures consisting of 0.5 ml of the diluted serum to be tested, 0.25 ml of 10 % erythrocyte suspension of conforming blood group and 0.25 ml of a 20,000 per cubic mm leukocyte suspension are administered to 3 mice. After 3 hours peritoneal exudate smears are examined for the presence and percentage of erythro- and leukophagocytosis. A positive reaction is indicated by phagocytosis observed in more than 3 % of the mouse leukocytes. In a series consisting of 25 cases of immunohematological disorders, erythrophagocytosis could be detected in 14 cases, leukophagocytosis in 9 cases and simultaneous erythro-leukophagocytosis in 9 instances. Parallel in vitro tests disclosed the presence of antibodies against erythrocytes in 12, against leukocytes in 5 and against both in 4 cases. The testing of 20 control subjects yielded uniformly negative results. The method can be used for the detection of heterocytotropines, complete and incomplete auto-antibodies, both as a direct and as an indirect reaction. 4 Hungarian, 21 1/1 Western references. The determination of phosphatase and esterase in serum. *Sándor Dán* (Dickmann) and *István Fajda* (Univ., Debrecen, Hung.). *Kisérletes Orvostudomány* 1, 118-21(1949).— (A). For the detn. of phosphatase measure into 4 test tubes 2 ml. of an alk. buffer (dissolve in 1 l. water Na_2CO_3 anhyd. 6.36, NaHCO_3 3.36 g.) or of an acid buffer (mix 3 ml. 0.1 N AcOH with 7 ml. 0.1 N NaOAc), 2 ml. of substrate (2.18 g. di-Na phenylphosphate in 1 l. H_2O), put in 37° water bath for 3 min., add 0.2 ml. serum to 2 tubes, stopper all 4 tubes, keep them in the water bath for 15 min., cool for 1 min. in tap water, add 1.8 ml. 20% CCl_3COOH to the tubes with serum, add to the other 2 tubes 0.2 ml. serum and 1.8 ml. 20% CCl_3COOH , shake, and filter. In the meantime measure 2 ml. 5% H_2SO_4 into 4 Hagedorn-Jensen tubes, add 3 ml. of the filtrate of the above test tubes, 2 ml. 0.01 N KMnO_4 , let stand for 8-10 min., add 1 ml. freshly prepd. 5% KI soln., and titrate with 0.05 N $\text{Na}_2\text{S}_2\text{O}_4$. The difference between titration results of both pairs of tubes should be multiplied by 11 to obtain the King-Armstrong value for 0.1 ml. serum. (B). For the detn. of esterase measure into 4 test tubes 5 ml. of buffer (prep. by mixing 100 ml. of a soln., contg. in 1 l. doubly distd. water 5.35 g. $\text{Na}_2\text{HPO}_4 \cdot 12 \text{H}_2\text{O}$ and 70 g. $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$, with 0.2 ml. of 2% phenylbenzate in MeOH), add to 2 tubes 0.3 ml. diel. serum (add 5.0 ml. distd. water to 0.1 ml. serum), keep in a 37° water bath for 1 hr., add 2 ml. 20% CCl_3COOH to the tubes contg. serum, cool the serum-free tubes and add 0.3 ml. serum and 2 ml. CCl_3COOH to them, keep in water bath for 10 min., let stand at room temp., filter, treat 5 ml. of filtrate as under (A), and titrate similarly. The difference in titration values should be multiplied by 33.5 to obtain esterase activity according to Cömöri. *István Fajda*

"Healed Cardiac Damage, Caused by Trauma from Lightning, Which Could be Classified Clinically as an Infarct."

Budapest, Orvosi Hetilap, Vol 107, No 36, 4 Sep 66, pages 1715-1717.

Abstract: [Authors' Hungarian summary] Recovery of a case of cardiac damage, caused by trauma from lightning, is reported which had the clinical appearance of a typical dorsal cardiac infarct. Attention is called to the inadequate protection available against lightning at the agricultural regions of Hungary. By correction of this situation, the number of victims of lightning could be reduced. 3 Hungarian, 13 Western references.
